

Shrinking the IAM Attack Surface through Identity Visibility and Intelligence Platforms (IVIP)

CyberIntel Threat Advisory - automated analysis of source reporting: affected systems, actor attribution, and recommended actions.

INTELLIGENCE SNAPSHOT

Issued by	CyberIntel
Date	15 June 2026
Source	thehackernews
Threat Level	UNKNOWN
Affected Systems / Vendors	-
Threat Actors	-
CVEs	None identified
Reference	https://thehackernews.com/2026/06/shrinking-iam-attack-surface-through.html
Classification	For Authorised Recipients

Executive Summary

The article highlights the growing challenge of identity fragmentation in enterprise environments, where nearly half of identity activity occurs outside centralized IAM visibility, creating 'Identity Dark Matter.' Gartner's new Identity Visibility and Intelligence Platform (IVIP) category aims to address this by providing a unified visibility and observability layer. Orchid Security's IVIP solution uses binary analysis and dynamic instrumentation to discover and analyze identity activity across applications, revealing risks such as excessive privileges, orphaned accounts, and external domain usage. Adopting an IVIP approach enables evidence-driven identity intelligence and automated remediation to shrink the attack surface.

■ THREAT LEVEL: UNKNOWN

FOCUS: THREAT INTELLIGENCE & MITIGATION

Detection Measures & Mitigation

- ✓ Adopt Identity Visibility and Intelligence Platform (IVIP) for continuous discovery of human and non-human identities
- ✓ Implement binary analysis and dynamic instrumentation to inspect authentication logic inside applications
- ✓ Unify fragmented identity data from directories, applications, and infrastructure into a single evidence layer
- ✓ Leverage AI-driven analytics to convert identity telemetry into actionable security insights
- ✓ Enable automated remediation and real-time signal sharing (e.g., CAEP) for immediate security actions

Conduct cross-estate identity audits to identify excessive privileges, orphaned accounts, and external domain risks
